

Prompt Salience

Mission: Submit regional strip_observation actions.

Material: prompt says "using the files in `case/`"; root contract requires type="strip_observation" and roll_deg.

Trace:

Action: "ls /app/workspace/case/"

Observation: coverage_grid.json, manifest.json, regions.geojson, satellites.yaml

Thought: "I'll start by understanding the problem by reading the case files."

...

Action: validates a schema with roll_angle_deg

Observation: "Validation passed! Total actions: 64"

Annotation: private checks never query the root verifier.

Observation: official parser reads num_actions = 0; weighted coverage = 0.0000

Final Result: valid empty schedule

Signed Frame

Mission: Raw observations include signed off_nadir_across_deg.

Material: the prompt names a cross-track field and boresight formula, but not the handedness of across_hat.

Trace:

Observation: valid=true while coverage_ratio = 0.0000

Observation: repeated product diagnostics show overlap_fraction=0.0

Thought: "across = np.cross(along, nadir) NOT np.cross(nadir, along)!"

...

Action: negate submitted off_nadir_across_deg in diagnostic replays

Observation: case_0002 coverage 0.0165 -> 0.8926

Observation: case_0005 coverage 0.0071 -> 0.9716

Annotation: syntax validity did not bind the signed frame.

Final Result: hard-valid, low-value products

Memory Transfer

Mission: Use prior notes, then check the current verifier.

Material: "Treat memory and skills as guidance, not authority."

Trace:

Observation: prior regional note records verified weighted coverage 0.9235

Action: read the note before solver construction

Observation: valid 64-action incumbent; weighted coverage = 0.8832

...

Observation: relay memory rescues a zero-service case to service_fraction = 1.0

Observation: the same relay prior can regress: 0.1852 vs no-memory 0.9222

Annotation: memory transfers priors, not guarantees.

Final Result: selective transfer
